Case 3

- 27 years old female
- Recurrent, Supraclavicular, subcutaneous mass
- Received Two paraffin blocks for confirmation
Diagnosis

Proliferative Myositis / Proliferative Fascitis
Proliferative Fascitis/ Myositis

- Subcutaneous proliferation of large ganglion-like cells + plumb fibroblastic / myofibroblastic cells similar to those seen in nodular fascitis

- Middle age and adult

- Upper extremities (forearm); Lower extr. And trunk
Proliferative Myositis / Fascitis

- **IHC:** similar to that of nodular fascitis
- **Positive for:** SMA; MuscleSpecific Actin
- **Negative for:** Desmin;
- **Ganglial like cells are:** focally positive for CD68 and Actins; negative for S100 and CK
- **Proliferative F/ M recur rarely after excision and do not metastasize**
